

Hours Engine Scan — Sample Report

Illustration. This is a fictional company built with the same evidence labels and depth as a real Hours Scan. Numbers are illustrative, not from a real client. Your report is written from your files.

1. Executive summary

Achterhuis & Zonen — 4-person plumbing and heating service business, Rotterdam.

Sources used: one website host + one owner quote spreadsheet (last 30 days). No live mailbox login.

Three leaks showed up. Only **quote handling** had duration in the file, so only that line ranks as **Measured hours**. Inbox delay is **Waiting time** (not multiplied by €40). The website form is a **Website hypothesis** — no hours, no euro.

Recommendation: **PARK** the inbox-euro claim until a mailbox export exists. **GO** candidate: quote-to-order, if you later choose a build — this scan does not set a build price.

2. How the scan ran

- Hours Scan (€149 excl. VAT). You sent: site URL + quote spreadsheet.
- Window written down by the owner: last 30 days.
- All numbers below carry a label. Nothing here is “measured in session”.

3. Evidence labels used

Label	Meaning
Measured hours	Duration or start–end in the file
Waiting time	Calendar delay — not × €40
You stated	A number you declared, dated
Website hypothesis	Public-site friction — no hours, no euro
Not enough data	No ranking invented

4. Findings

#	Process	Hours/week	Label	Note
1	Quote to order flow	4 h	Measured hours	Duration column in the quote sheet
2	Inbox delay	3 calendar days median	Waiting time	Not multiplied by €40
3	Site lead capture	—	Website hypothesis	Form friction; no hours
4	Monthly reporting pack	—	Not enough data	No duration in the file
5	Purchase-order matching	—	You stated	Owner: “half an hour, not worth it”

Ranking (measured hours only): quote-to-order, 4 h/week.

Math on that line: 4 h/week × €40/h = €160/week of measured owner time. We do **not** write “pays back in weeks” — that needs a build price, which this scan does not set.

5. Website (hypothesis only)

Public host crawled (one hostname, self-host). Observations: quote CTA buried, no SLA on the form. These are hypotheses. They do not enter the hours ranking.

6. What we would NOT automate

Purchase-order matching — owner-stated volume too low. That is a successful scan line: **NO**.

7. What you keep

This report is yours regardless of whether we build. GO on a scan line is **not** start of build.
