

Inbox Killer — Before & After (1 page)

Forward this to a partner, employee or accountant. Process proof from a live system — no fabricated metrics.

Before — one mixed inbox, read by hand

Incoming email (everything in one pile)

```
|
├─ Leads      → sometimes missed
├─ Clients    → answered late
├─ Invoices   → buried under noise
└─ Newsletters → steal attention every morning
```

Owner reads everything manually · same replies typed again · follow-ups forgotten

Typical pain: hours lost to triage, lost enquiries, stress before the real work starts.

After — sorted lanes, drafts ready, you approve every send

Inbox Killer agent

```
|
├─ Read      → 100+ messages per scan (test-environment proof)
├─ Classify  → lead · client · invoice · noise
├─ Sort      → clear lanes, noise archived
├─ Draft     → reply in your voice, ready to review
└─ 🛑 APPROVE → you edit, send or delete – nothing auto-sends
```

classify → plan → diff → approve

What's real today: process proof in a supervised test environment — human-in-the-loop on every outbound message. Not a claim that a client production mailbox is already live.

Measurement: estimate ~ a few hours/week saved — confirmed per client after setup (no invented numbers).

Why this is safe for a small business

- **Human-in-the-loop by design** — the system proposes; you decide.
 - **Service accounts** — scoped access, revocable, no passwords over chat.
 - **Test inbox first** — we can run on test@yourdomain.nl before touching live mail.
 - **EU data, logged actions** — available on request for review.
-

Next step

Not sure if your inbox is worth automating first? Book a paid **Hours Engine Scan** — you send files, we measure, document is yours either way.
